

Prince Raj // Portfolio Project Status Report

1. Implementations & Fixes Completed

Entry Sequence & Core Layout

- **Encrypted Entry Screen:** Built a terminal-styled vignette page that cycles "SIGNAL ENCRYPTED" across multiple languages (English, Spanish, Japanese, Russian, Chinese) before shattering into the main site.
- **Smooth Navigation:** Fixed anchor scrolling teleports by enabling native smooth scrolling behavior across the application.
- **Custom Optics:** Replaced the standard mouse cursor with a custom amber tactical sniper crosshair globally.
- **Navigation Polish:** Added an interactive, center-expanding amber underline (`w-3/4`) to the main header navigation links (`DOSSIER` , `LOADOUT` , etc.) upon hover.

Dossier & Commando Avatar

- **Custom Vector Integration:** Imported the provided complex commando stencil (`commando.svg.jpg`).
- **Tactical Rendering:** Applied dynamic CSS filters (inversion, sepia, saturation, hue-rotation) to natively integrate the white/black JPG as a glowing amber asset on a dark background without clashing.
- **Aspect Ratio Fix:** Unlocked the grid constraints and set the avatar container to `aspect-[3/4]` (portrait), guaranteeing the character renders fully without being chopped by square cropping.

Loadout & Skills

- **Skill Vectors:** Replaced standard text chips with high-quality SVG brand logos (Python, JS, C, Java, Firebase, GitHub, Linux, DSA, etc.) leveraging the SimpleIcons CDN and Lucide.
- **Universal Reactivity:** Configured every single UI icon across the site (proficiencies, project links, footer links, game icons) to scale up (`scale-125`) and emit a glowing amber drop-shadow when targeted by the cursor.

Off-Duty Protocols (Gaming)

- **Experience Tracking:** Added highly specific tracking metrics for game experience: Call of Duty: Mobile (7 Yrs), BGMI (7 Yrs), Clash of Clans (10 Yrs), and Brawl Stars (3 Yrs).
- **Dynamic Statuses:** Adjusted the grid layout to cleanly display Role, Experience, and Status concurrently.
- **Accurate Roles:** Corrected the Clash of Clans role to "Co-Leader" and demoted Brawl Stars to an "OCCASIONAL" activity status.

Campaign Logs (Projects)

- **Status Badges:** Tagged specific projects as `ACCOMPLISHED` with corresponding visual styling.
- **Link Interactions:** Wired the `View Source` (GitHub) and `Deploy Target` (External Link) buttons to react dynamically on hover.

Secure Channel (Footer)

- **Privacy Sweep:** Explicitly removed the mobile phone number from the public site.
 - **Email Refinement:** Simplified the email button to display "MAIL" while guaranteeing it triggers the user's default email composer (bypassing strict iframe sandbox policies).
 - **Stealth Discord Copy:** Hid the raw Discord username from plain sight, converting the button into a stealth copy-to-clipboard mechanism that flashes "ID COPIED!" on click.
-

2. Future Implementation Plan (Next 72 Hours)

Phase 1: Data Integration & Deployment

- **Project Repo Linking:** Await the final GitHub repository URLs for *Study Roadmap Tracker*, *Threat Monitor*, *Classroom AI - Monitor*, and *Campus Gigs*, and wire them into the Campaign Logs.
- **Live Deployment:** Initialize hosting on a zero-cost cloud platform (Vercel, Netlify, or Firebase Hosting). Configure the build commands and set up continuous integration so future commits automatically deploy.

Phase 2: Mobile Optimization Sweep

- **Responsive Grid Checks:** Conduct a rigorous QA pass across mobile viewports (phones and tablets) to ensure grid layouts collapse correctly without overlapping text.
- **Touch Interactions:** Verify that hover-based animations degrade gracefully on touchscreens and that the custom crosshair does not interfere with native mobile tapping.
- **Animation Performance:** Ensure Framer Motion spring physics remain performant and smooth on lower-end mobile devices.

Phase 3: Final Polish & SEO

- **Search Engine Optimization:** Inject necessary meta tags, descriptions, and Open Graph headers into `index.html` so the site generates a sleek preview card when shared on platforms like LinkedIn or Discord.
- **Asset Optimization:** Compress and optimize any residual local images to guarantee instant load times.
- **Easter Egg Finalization:** Finalize the Konami code sequence logic in the Trophy Room/Achievements panel to ensure it triggers correctly on live servers.
